Modi elementari

- **1.** $\lambda_i \neq 0$: $\binom{t}{k} \lambda_i^{t-k} \sim t^k \lambda_i^t = t^k e^{t(\ln \lambda_i)}$ (In(·) = logaritmo naturale complesso)
- **2.** $\lambda_i = 0$: modi elementari si annullano dopo un numero finito di passi!

Non esiste una controparte modale a tempo continuo!!
