Soluzioni di un sistema lineare autonomo?

Caso vettoriale

1.
$$\lambda_i \neq 0$$
: $\binom{t}{k} \lambda_i^{t-k} \sim t^k \lambda_i^t = t^k e^{t(\ln \lambda_i)}$ (In(·) = logaritmo naturale complesso)

2. $\lambda_i = 0$: modo elementari si annullano dopo un numero finito di passi!

Non esiste una controparte modale a tempo continuo!!
